## **New research opens the door to understanding human tonsil cancer**

**Vancouver** – Researchers at Simon Fraser University and the BC Cancer Agency have developed a groundbreaking method to identify and separate stem cells that reside in the tonsils. Their research, which sheds new light on the fight against oral cancer, is published in the journal [Stem Cell Reports](#).

While stem cells in many other body tissues have been well studied, little is known about these stem cells, says researcher Catherine Kang, a PhD student in the Department of Biomedical Physiology and Kinesiology and lead author of the paper. Ninety per cent of human tonsil cancers show evidence of HPV (human papillomavirus) infection. But little is known about its role in causing these cancers. Researchers suspect it is a key player, as HPV is the major risk factor for cervical cancer.

Kang, who is working with BPK professor Miriam Rosin, director of the BC Oral Cancer Prevention Program, and UBC professor Connie Eaves of the Terry Fox Laboratory, was interested in finding out why the tonsil is particularly susceptible to HPV and wondered if it might have something to do with the stem cells of the tissue that coats the tonsils.

When she purified these cells and made them incorporate a cancer-causing gene normally transmitted by HPV, the cells grew abnormally in a special tissue culture system, and created what one might imagine what the beginning stages of human tonsil cancer would look like.

“This is a very exciting finding, as it is the first stage of human cancer development that researchers need to learn how to detect and eliminate,” says Kang. The study shows how it can now be done and then studied at will in a petri dish using cells isolated directly from human tonsils.

Cancer of oropharynx, or the tonsils in particular, is an important health concern with rising incidence worldwide, especially in men. The researchers, including Dr. Raj Kannan of the BC Cancer Agency's Terry Fox Laboratory, say this new method will now allow these next steps to go forward not just here, but around the world, to stop this global trend in its tracks.

This work was supported by grants from the Canadian Cancer Society Research Institute, the Canadian Cancer Research Society and the B.C. Cancer Foundation.

**THE BC CANCER AGENCY**, an agency of the Provincial Health Services Authority, is committed to reducing the incidence of cancer, reducing the mortality from cancer, and improving the quality of life of those living with cancer. It provides a comprehensive cancer control program for the people of British Columbia by working with community partners to deliver a range of oncology services, including prevention, early detection, diagnosis and treatment, research, education, supportive care, rehabilitation and palliative care. For more information, visit [www.bccancer.bc.ca](http://www.bccancer.bc.ca).

**SIMON FRASER UNIVERSITY:** As Canada's engaged university, SFU is defined by its dynamic integration of innovative education, cutting-edge research and far-reaching community engagement. SFU was founded 50 years ago with a mission to be a different kind of university—to bring an interdisciplinary approach to learning, embrace bold initiatives, and engage with communities near and far. Today, SFU is Canada's leading comprehensive research university and is ranked one of the top universities in the world. With campuses in British Columbia's three largest cities – Vancouver, Burnaby and Surrey – SFU has eight faculties, delivers almost 150 programs to over 35,000 students, and boasts more than 130,000 alumni in 130 countries around the world.
