

BC Cancer Protocol Summary for Treatment of Non- Metastatic Castration Resistant Prostate Cancer Using Apalutamide

Protocol Code: UGUPAPA

Tumour Group: Genitourinary

Contact Physician: Dr. Christian Kollmannsberger
Dr. Daniel Khalaf

ELIGIBILITY:

- ECOG performance status 0-2
- Patients with non-metastatic castration resistant prostate cancer (nmCRPC) who are chemotherapy naïve
- Patients with nmCRPC with a PSA doubling time of less or equal to 10 months.
- Patients with no radiologic evidence of metastases (negative bone scan, negative CT of pelvis, abdomen, chest)
- Patients with nmCRPC are eligible to receive either apalutamide (UGUPAPA) OR enzalutamide (UGUNMPENZ) but not their sequential use
- Patients who have progressed on apalutamide in nmCRPC (UGUPAPA):
 - are NOT eligible to receive enzalutamide (UGUPENZ) or abiraterone (UGUPABI) in metastatic CRPC
 - are eligible to receive DOCEtaxel (GUPDOC) and/or cabazitaxel (GUPCABA) in the metastatic CRPC
- A BC Cancer “Compassionate Access Program” (CAP) request must be approved prior to treatment

EXCLUSIONS:

- Metastatic prostate cancer
- Prior treatment with enzalutamide or abiraterone
- Prior treatment with DOCEtaxel plus androgen deprivation therapy (GUPDOCADT)

TESTS:

- Baseline: CBC and diff, platelets, creatinine, sodium, potassium, blood pressure, TSH, PSA
- Each time seen by physician: PSA, blood pressure
- If clinically indicated: TSH, creatinine, sodium, potassium, ECG

TREATMENT:

Drug	Dose	BC Cancer Administration Guideline
apalutamide	240 mg	PO once daily (dispense each 30-day supply in original container)

One cycle consists of 4 weeks (30 days) of apalutamide. Dispense a 90 day supply with each physician visit. Treat until disease progression or unacceptable toxicity.

Dose reduction:

Dose level -1: apalutamide 180 mg PO daily

Dose level -2: apalutamide 120 mg PO daily

Androgen ablative therapy (e.g., LHRH agonist, LHRH antagonist) should be maintained. Discontinue other antiandrogen (e.g., bicalutamide), if used as part of combined androgen blockade.

DOSE MODIFICATION:

Rash management:

Grade	Management
1	Continue apalutamide at current dose. Initiate topical steroid cream AND oral antihistamine
2	May continue apalutamide, or hold at treating physician's discretion Initiate topical steroid cream AND oral antihistamine If symptoms improve to equal or less than grade 1, restart apalutamide at same dose (240 mg PO daily)
≥ 3	Hold apalutamide Initiate topical steroid cream AND oral antihistamine Consider short course oral steroid If symptoms improve to equal or less than grade 1, restart apalutamide at same dose (240 mg PO daily), or reduced dose by one dose level (180 mg PO daily) If toxicity recurs at Grade 3 or higher, reduce dose by one dose level (180 mg PO daily or 120 mg PO daily).

PRECAUTIONS:

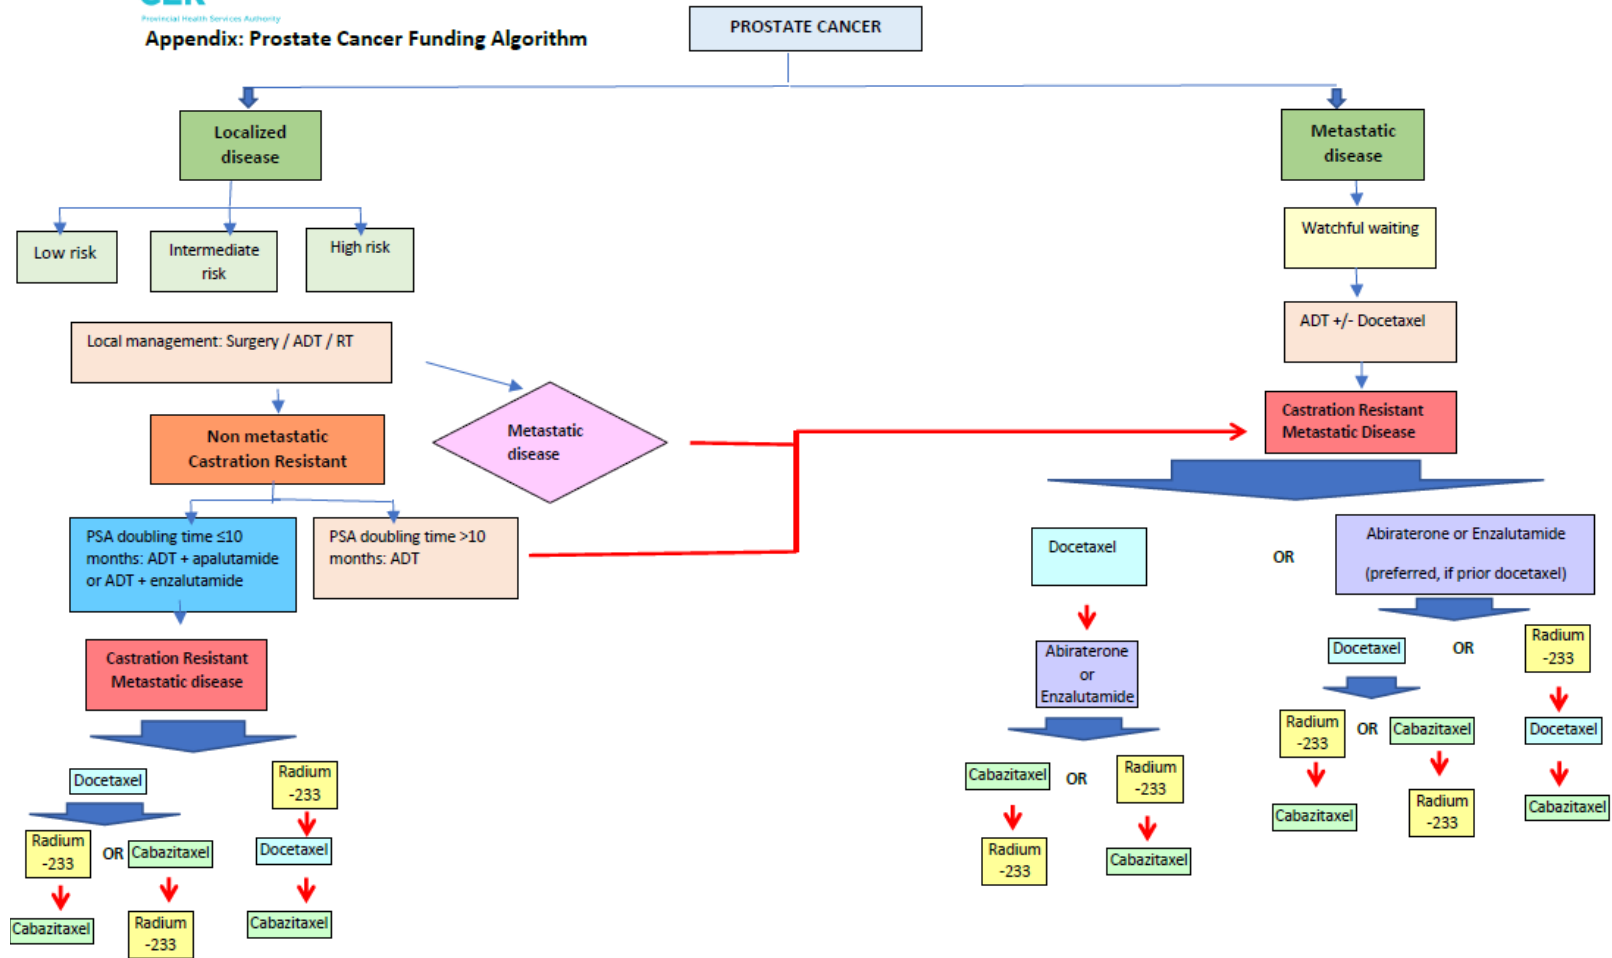

- Rash:** Rash is reported in 25% of patients on apalutamide. It is commonly described as macular or maculopapular in presentation and has a median onset within 3 months. It typically resolves after 2 months. Corticosteroids and antihistamines have been used to treat the rash (see rash management table).
- Hypothyroidism:** Grade 1-2 hypothyroidism is reported in up to 22% of patients receiving apalutamide. Median onset is 4 months. Monitor TSH throughout treatment and initiate thyroid replacement as indicated.
- Falls and fractures:** Falls and fractures have been associated with apalutamide. Mechanism unknown. Fractures have been reported within one month and up to 32 months after treatment initiation.
- Drug interactions:** CYP2C8 inhibitors (e.g. gemfibrozil) and CYP 3A4 inhibitors (e.g. ketoconazole) may increase the serum level of apalutamide.
- Seizures:** Seizures have been reported in patients on apalutamide. Onset of 12-16 months after treatment initiation. Use cautiously in patients with a history of seizures or other predisposing factors. Permanently discontinue apalutamide in patients who develop a seizure during treatment.
- Hypertension:** Apalutamide may result in an increased blood pressure. This rarely leads to discontinuation or dose modification, but may require antihypertensive treatment. Monitor blood pressure frequently.

Call Dr. Christian Kollmannsberger or tumour group delegate at (604) 877-6000 or 1-800-663-3333 with any problems or questions regarding this treatment program.

Appendix: Prostate Cancer Funding Algorithm

ADT: Androgen Deprivation Therapy (LHRH agonist +/- antiandrogen)

Mitoxantrone: can be used at any time for metastatic castration resistant disease
