BC Cancer Protocol for Treatment of Platinum Resistant Epithelial Ovarian Cancer with Bevacizumab and PACLitaxel

Protocol Code: UGOOVBEP
Tumour Group: Gynecologic Oncology
Contact Physician: Dr. Anna Tinker

ELIGIBILITY:
- Epithelial ovarian cancer, primary peritoneal, or fallopian tube carcinoma
- Platinum resistant disease (progression within six months of completing a platinum-containing treatment protocol)
- Any number of prior lines of treatment
- A BC Cancer “Compassionate Access Program” (CAP) request must be approved prior to treatment

EXCLUSIONS:
- Progressed while being treated on prior bevacizumab therapy
- Neutrophils less than 1 x 10^9/L
- Performance status greater than ECOG 3
- Major surgery within 4 weeks
- Uncontrolled hypertension
- Pregnancy or breastfeeding
- Bleeding diathesis
- History of bowel obstruction or unresolved bowel obstruction (see note in Precautions section, below)

RELATIVE CONTRAINDICATIONS:
- Pre-existing motor or sensory neuropathy greater than grade 2
- Uncontrolled arterial or venous thromboembolism
- MI or CVA within 4 months
- Avoid NSAIDS and ASA if possible
- At risk of bowel obstruction (see note in Precautions section, below)

TESTS:
- Baseline: CBC & diff, platelets, creatinine, liver function tests (including bilirubin, AST, Alk Phos), electrolytes, dipstick or laboratory urinalysis for protein, blood pressure (BP) measurement, imaging as appropriate, tumor markers as appropriate
- Before each treatment: CBC & diff, dipstick or laboratory urinalysis for protein, blood pressure measurement, any initially elevated tumor marker, liver function tests (if clinically indicated), creatinine (if clinically indicated)
- 24 hour urine for protein if occurrence of proteinuria (dipstick urinalysis shows 2+ or 3+ or laboratory urinalysis for protein is greater than or equal to 1 g/L)
- Blood pressure measurement to be taken pre- and post-dose in first three cycles, and then pre-dose only subsequently
- For patients on warfarin, weekly INR until stable warfarin dose established, then INR at the beginning of each cycle
- Weight at baseline and every scheduled physician’s visit
PREMEDICATIONS:
- **PACLitaxel must not be started unless the following drugs have been given:**
  - 45 minutes prior to PACLitaxel:
    - dexamethasone 20 mg IV in 50 mL NS over 15 minutes
  - 30 minutes prior to PACLitaxel:
    - diphenhydrAMINE 50 mg IV and ranitidine 50 mg IV in 50 mL NS over 20 minutes
    (compatible up to 3 hours when mixed in bag)

ANTIEMETIC THERAPY POST-CHEMOTHERAPY:
- additional antiemetics not usually required (see SCNAUSEA)

TREATMENT: (give PACLitaxel first)

<table>
<thead>
<tr>
<th>Drug</th>
<th>Starting Dose</th>
<th>BC Cancer Administration Guideline</th>
</tr>
</thead>
<tbody>
<tr>
<td>PACLitaxel</td>
<td>175 mg/m² (or conservative dosing of 155 mg/m² or 135 mg/m²)</td>
<td>IV in 500 mL NS over 3 hours (use non-DEHP bag and non-DEHP tubing with 0.22 micron or smaller in-line filter)</td>
</tr>
<tr>
<td>bevacizumab</td>
<td>15 mg/kg*</td>
<td>IV in 100 mL** NS over 30 minutes to 1 hour***</td>
</tr>
</tbody>
</table>

Repeat every 21 days for 6 cycles or until progression or unacceptable toxicity occurs.

* bevacizumab dose does not need to be recalculated after Cycle 1 even if weight changes

** if bevacizumab dose is greater than 1650 mg, use 250 mL NS bag

*** first infusion over 60 minutes; subsequent infusions over 30 minutes. Observe for fever, chills, rash, pruritus, urticaria, or angioedema and stop infusion and contact the physician if any of these occur. Infusion reactions should be treated according to severity. If the bevacizumab infusion is restarted then it should be given at an initial rate to complete after 60 minutes or longer.

If acute hypertension (increase in BP measurement of greater than 20 mmHg diastolic or greater than 150/100 if previously within normal limits) occurs during bevacizumab infusion – stop treatment. Resume at half the original rate of infusion if blood pressure has returned to pretreatment range within one hour. If blood pressure does not return to pretreatment range within one hour – hold bevacizumab; subsequent infusions of bevacizumab should be given over 3 hours. Acute hypertension that is symptomatic (e.g., onset of headaches or change in level of consciousness) or BP measurement of greater than 180/110 that does not improve within one hour of stopping bevacizumab is an urgent situation that requires treatment.

Use only normal saline for line priming and flushing.
DOSE MODIFICATIONS:

1. Hematological:

<table>
<thead>
<tr>
<th>ANC (x 10^9/L)</th>
<th>Platelets (x 10^9/L)</th>
<th>Doses (both drugs)</th>
</tr>
</thead>
<tbody>
<tr>
<td>greater than or equal to 1.0 and greater than or equal to 100</td>
<td>100%</td>
<td></td>
</tr>
<tr>
<td>less than 1.0 or less than 100</td>
<td>delay until recovery</td>
<td></td>
</tr>
</tbody>
</table>

2. Proteinuria:

There are 3 different measures of proteinuria that may be used to assess the need for modification of bevacizumab therapy – urine dipstick analysis (measured in + values), laboratory urinalysis for protein (measured in g/L) and 24-hour urine collections for protein (measured in g/24 hours).

Urine dipstick analysis or laboratory urinalysis for protein should be performed at baseline and then prior to each cycle:

<table>
<thead>
<tr>
<th>Degree of Proteinuria</th>
<th>Bevacizumab Dose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Neg or 1+ dipstick or less than 1 g/L laboratory urinalysis for protein</td>
<td>Administer Bevacizumab dose as scheduled</td>
</tr>
<tr>
<td>2+ or 3+ dipstick or greater than or equal to 1 g/L laboratory urinalysis for protein</td>
<td>Administer Bevacizumab dose as scheduled. Collect 24-hour urine for determination of total protein within 3 days before the next scheduled bevacizumab administration. Adjust Bevacizumab treatment based on the table below.</td>
</tr>
<tr>
<td>If urine dipstick shows 4+ at baseline or during treatment</td>
<td>Withhold Bevacizumab and proceed with 24 hour urine collection</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>24-Hour Urine Total Protein (g/24 hours)</th>
<th>Bevacizumab Dose</th>
</tr>
</thead>
<tbody>
<tr>
<td>less than or equal to 2</td>
<td>100%</td>
</tr>
<tr>
<td>greater than 2 to 4</td>
<td>Hold dose and recheck 24-hour urine every 2 weeks. When less than or equal to 2 g/24 hour, resume therapy at 10 mg/kg</td>
</tr>
<tr>
<td>greater than 4</td>
<td>Withhold/Discontinue bevacizumab</td>
</tr>
</tbody>
</table>
3. Hypertension:

<table>
<thead>
<tr>
<th>Blood Pressure (mmHg)</th>
<th>Bevacizumab Dose</th>
</tr>
</thead>
<tbody>
<tr>
<td>less than or equal to 150/100</td>
<td>100%</td>
</tr>
<tr>
<td>greater than 150/100</td>
<td>100%</td>
</tr>
<tr>
<td>asymptomatic</td>
<td>Notify physician and start or adjust antihypertensive therapy*</td>
</tr>
<tr>
<td>hypertensive crisis</td>
<td>discontinue therapy</td>
</tr>
</tbody>
</table>

- Antihypertensive therapy may include hydrochlorothiazide 12.5 to 25 mg PO once daily, ramipril (ALTACE®) 2.5 to 5 mg PO once daily, or amlodipine (NORVASC®) 5 to 10 mg PO once daily.

*Any patients presenting with chest pain, significant leg swelling, shortness of breath, new severe headaches or new neurologic symptoms, must be re-assessed by a physician before receiving further bevacizumab infusions.

4. Arthralgia and/or myalgia: The following regimen may be useful in preventing arthralgias/myalgias: gabapentin 300 mg PO on day before chemotherapy, 300 mg bid on treatment day, then 300 mg tid x 7 to 10 days.

If arthralgia and/or myalgia persists, reduce subsequent PACLitaxel doses to 135 mg/m².

5. Neuropathy: Dose modification or discontinuation may be required (see BC Cancer Cancer Drug Manual).

6. Hepatic dysfunction:

<table>
<thead>
<tr>
<th>ALT</th>
<th>Total Bilirubin</th>
<th>Paclitaxel Dose</th>
</tr>
</thead>
<tbody>
<tr>
<td>less than 10 x ULN and less than or equal to 1.25 x ULN</td>
<td>175 mg/m2</td>
<td></td>
</tr>
<tr>
<td>less than 10 x ULN and 1.26-2 x ULN</td>
<td>135 mg/m2</td>
<td></td>
</tr>
<tr>
<td>less than 10 x ULN and 2.01-5 x ULN</td>
<td>90 mg/m2</td>
<td></td>
</tr>
<tr>
<td>greater than or equal to 10 x ULN or greater than 5 x ULN</td>
<td>not recommended</td>
<td></td>
</tr>
</tbody>
</table>
PRECAUTIONS:

1. **Bowel-related Toxicities**: Use of bevacizumab carries a risk of bowel perforation and other serious bowel problems. In the AURELIA study, the bowel-related exclusion criteria were: history of bowel obstruction (including subocclusive disease) related to underlying disease, a history of abdominal fistula, GI perforation or intra-abdominal abscess, evidence of rectosigmoid involvement by pelvic examination, bowel involvement on CT imaging, or clinical symptoms of bowel obstruction.

2. **Hypersensitivity**: Reactions are common. See BC Cancer Hypersensitivity Guidelines

   | **mild symptoms** (e.g. mild flushing, rash, pruritus) | ▪ complete PACLitaxel infusion. Supervise at bedside  
   | ▪ no treatment required |  

   | **moderate symptoms** (e.g. moderate rash, flushing, mild dyspnea, chest discomfort, mild hypotension) | ▪ stop PACLitaxel infusion  
   | ▪ give IV diphenhydRAMINE 25 to 50 mg and IV hydrocortisone IV 100 mg  
   | ▪ after recovery of symptoms resume PACLitaxel infusion at 20 mL/h for 5 minutes, 30 mL/h for 5 minutes, 40 mL/h for 5 minutes, then 60 mL/h for 5 minutes. If no reaction, increase to full rate.  
   | ▪ if reaction recurs, discontinue PACLitaxel therapy |  

   | **severe symptoms** (i.e. one or more of respiratory distress requiring treatment, generalized urticaria, angioedema, hypotension requiring therapy) | ▪ stop PACLitaxel infusion  
   | ▪ give iv antihistamine and steroid as above. Add epinephrine or bronchodilators if indicated  
   | ▪ discontinue PACLitaxel therapy |  

3. **Extravasation**: PACLitaxel causes pain and may, rarely, cause tissue necrosis if extravasated. Refer to BC Cancer Extravasation Guidelines.

4. **Neutropenia**: Fever or other evidence of infection must be assessed promptly and treated aggressively.

5. **Gastrointestinal perforations and wound dehiscence**: Can be fatal. Typical presentation is reported as abdominal pain. Bevacizumab should be discontinued in patients with gastrointestinal perforation or wound dehiscence.

6. **Hemorrhage**: Bevacizumab has been associated with hemorrhage. Cases of CNS hemorrhage, some with fatal outcome, have been observed. Patients should be monitored for signs and symptoms of CNS bleeding. If Grade 3/4 hemorrhage occurs, discontinue bevacizumab. Patients with significant bleeding diatheses should not receive bevacizumab. Platelet inhibitory medications such as NSAIDS (including ASA at doses greater than 325 mg/day) should be discontinued prior to institution of bevacizumab. COX-2 inhibitors are permissible.

7. **Thrombosis**: A history of arterial thromboembolic events or age greater than 65 years is associated with an increased risk of arterial thromboembolic events with bevacizumab. If Grade 3 thromboembolic event or incidentally discovered pulmonary embolus arises, hold bevacizumab for 2 weeks, then consider resumption of bevacizumab if risks of tumour-related hemorrhage are judged low AND the patient is on a stable dose of anticoagulant. If a second Grade 3 thrombosis occurs, or if a Grade 4 thrombosis occurs, discontinue bevacizumab. Patients on warfarin should have INR checked frequently, at least once every 2-3 weeks, while receiving bevacizumab.

8. **Proteinuria**: Has been seen in all clinical trials with bevacizumab to date and is likely dose-dependent. If proteinuria of greater than or equal to 2 g/24 h persists for more than 3 months, consider further investigations - possibly a renal biopsy.

9. **Hypertension**: Has been seen in all clinical trials with bevacizumab to date and is likely dose-dependent. The most commonly used therapies are calcium channel blockers, ACE inhibitors and diuretics. Blood pressure should be monitored through routine vital signs evaluations. If hypertension is poorly controlled with adequate medication, discontinue bevacizumab.
10. **Reversible Posterior Leukoencephalopathy Syndrome (RPLS):** Rarely, patients may develop 90 mg/m² seizures, headache, altered mental status, visual disturbances, with or without associated hypertension consistent with RPLS. May be reversible if recognized and treated promptly.

11. **Congestive Heart Failure:** Has been reported in up to 3.5% of patients treated with bevacizumab. Most patients showed improvement in symptoms and/or LVEF following appropriate medical therapy.

Call Dr. Anna Tinker or tumour group delegate at (604) 877-6000 or 1-800-663-3333 with any problems or questions regarding this treatment program.
