BCCA Protocol Summary for Maintenance riTUXimab for Indolent Lymphoma

Protocol Code
LYRMTN

Tumour Group
Lymphoma

Contact Physician
Dr. Laurie Sehn

ELIGIBILITY:

- Histology: Follicular lymphoma, grade 1, 2 or 3A, Lymphoplasmacytic lymphoma, and marginal zone lymphoma after completion of a course of chemotherapy. NOTE: Maintenance riTUXimab is not recommended for small lymphocytic lymphoma, which should be managed similarly to chronic lymphocytic leukemia or for follicular grade 3B lymphoma, which should be managed similarly to diffuse large B cell lymphoma.
  - After first line chemotherapy or chemotherapy for relapsed disease
  - Response status: At least a partial response must have occurred in response to the preceding chemotherapy
- Histology: Mantle Cell lymphoma, after first line chemotherapy only. NOTE: Maintenance riTUXimab is not recommended for relapsed Mantle Cell lymphoma.
  - Response status: At least a partial response must have occurred in response to the preceding chemotherapy

TESTS:

- Baseline (required before first treatment): CBC and diff, platelets, bilirubin, AST, ALT
- Baseline (required, but results do not have to be available to proceed with first treatment; results must be checked before proceeding with further treatment): hepatitis BsAg, hepatitis Bcore antibody, hepatitis C antibody (need not be repeated if tested previously).
- Before each treatment: CBC and diff, platelets

PREMEDICATIONS:

- diphenhydrAMINE 50 mg PO prior to riTUXimab and then q 4 h during the IV infusion, if the infusion exceeds 4 h
- acetaminophen 650 to 1000 mg PO prior to riTUXimab and then q 4 h during the IV infusion, if the infusion exceeds 4 h

predniSONE 50 mg PO prior to riTUXimab (optional, to be used if previous maintenance doses of riTUXimab required more than 90 minutes to infuse)

SUPPORTIVE MEDICATIONS:

If HBsAg or HBcoreAb positive, start lamivUDine 100 mg/day PO for the duration of riTUXimab therapy and for six months afterwards.
TREATMENT:

Note that the riTUXimab is given every 3 months, not weekly as is used when riTUXimab is used as single agent.

<tbody>
<tr>
<td>riTUXimab</td>
<td>375 mg/m²</td>
<td>IV in 250 mL NS over 1 hour 30 min (doses between 500 to 1000 mg can be prepared in either 250 mL or 500 mL NS) once every 3 months for a total of 8 doses over 2 years</td>
</tr>
</tbody>
</table>

*Infuse the riTUXimab intravenously: initial 50 mL of 250 mL bag (or 100 mL of 500 mL bag) of the dose over 30 minutes then infuse the remaining 200 mL of 250 mL bag (or 400 mL of 500 mL bag) (4/5) over 1 hour (total infusion time = 1 hour 30 min). Development of an allergic reaction may require a slower infusion rate. See hypersensitivity below and note optional use of prednisone for subsequent infusions.

Repeat every 3 months for a total of 8 doses over 2 years

**The risk of cytokine release syndrome is low but is increased when the peripheral blood lymphocyte count is greater than 30 to 50 x 10⁹ /L. While there is no requirement to withhold riTUXimab based on lymphocyte count, clinicians may wish to pre-medicate patients with high tumour burden with steroids prior to riTUXimab infusion or omit the riTUXimab from the first cycle of treatment.

DOSE MODIFICATIONS:

1. Hematological:

</table>

PRECAUTIONS:

1. **Hypersensitivity**: Refer to BCCA Hypersensitivity Guidelines. riTUXimab can cause allergic type reactions during the IV infusion such as hypotension, wheezing, rash, flushing, alarm, pruritus, sneezing, cough, fever or faintness. For maintenance dose # 1, patients are to be under constant visual observation during all dose increases and for 30 minutes after infusion completed. For all subsequent maintenance doses (# 2 to 8), constant visual observation is not required. Vital signs are not required unless symptomatic. Because transient hypotension may occur during infusion, consider withholding antihypertensive medications 12 hours prior to riTUXimab infusion. If an allergic reaction occurs, stop the infusion and the physician in charge should determine a safe time and rate to resume the infusion. A reasonable guideline is as follows. After recovery of symptoms, restart riTUXimab infusion at ½ the preceding infusion rate and continue with escalation of infusion rates every 30 minutes.

2. **Fatal Cytokine Release Syndrome**. Fatal cytokine release syndrome should be very rare or not seen at all in this patient population who lack circulating lymphoma cells and bulky disease. It usually occurs within 1 to 2 hours of initiating the first riTUXimab infusion. Initially, it is characterised by severe dyspnea (often with bronchospasm and hypoxia) in addition to fever, chills, rigors, urticaria and angioedema. Pulmonary interstitial infiltrates or edema visible on chest x-ray may accompany acute respiratory failure. There may be features of tumour lysis syndrome such as hyperuricemia, hypocalcemia, acute renal failure and elevated LDH. For severe reactions, stop the infusion immediately and evaluate for tumour lysis syndrome and pulmonary infiltration. Aggressive symptomatic treatment is required. The infusion can be resumed at no more than one-half the previous rate once all symptoms have resolved, and laboratory values and chest x-ray findings have normalized. The risk of cytokine release syndrome is low but is increased when the peripheral blood lymphocyte count is greater than 30 to 50 x 10⁹ /L. While there is no requirement to withhold riTUXimab based on lymphocyte count, clinicians may wish to pre-medicate patients with high tumour
burden with steroids prior to riTUXimab infusion or omit the riTUXimab from the first cycle of treatment.

3. **Neutropenia**: Fever or other evidence of infection must be assessed promptly and treated aggressively

4. **Rare Severe Mucocutaneous Reactions**: (similar to Stevens-Johnson Syndrome) have been anecdotally reported. If such a reaction occurs, riTUXimab should be discontinued.

5. **Hepatitis B Reactivation**: All lymphoma patients should be tested for both HBsAg and HBcoreAb. If either test is positive, such patients should be treated with lamivudine during riTUXimab maintenance and for six months afterwards. Such patients should also be monitored with frequent liver function tests and hepatitis B virus DNA at least every two months. If the hepatitis B virus DNA level rises during this monitoring, management should be reviewed with an appropriate specialist with experience managing hepatitis and consideration given to halting riTUXimab maintenance.

Call tumour group chair at (604) 877-6000 or 1-800-663-3333 with any problems or questions regarding this treatment program.
