Pembrolizumab (pem" broe liz' ue mab) is a drug that is used to treat some types of cancer. It is a monoclonal antibody, a type of protein designed to target and interfere with the growth of cancer cells. It is a clear liquid that is injected into a vein.

Tell your doctor if you have ever had an unusual or allergic reaction to pembrolizumab before receiving pembrolizumab.

A blood test may be taken before each treatment. The dose and timing of your treatment may be changed based on the test results and/or other side effects.

Other drugs may interact with pembrolizumab. Check with your doctor or pharmacist before you start or stop taking any other drugs.

The drinking of alcohol (in small amounts) does not appear to affect the safety or usefulness of pembrolizumab.

Pembrolizumab may damage sperm and may harm the baby if used during pregnancy. It is best to use birth control while being treated with pembrolizumab and for at least 4 months after the last dose. Tell your doctor right away if you or your partner becomes pregnant. Do not breastfeed during treatment and for at least 4 months after the last dose.

Tell doctors, dentists, and other health professionals that you are being treated with pembrolizumab before you receive any treatment from them.

Side effects are listed in the following table in the order in which they may occur. It is important to report side effects immediately to your doctor. Do not manage side effects at home without speaking with your doctor. Symptoms may be delayed and can develop months after your last dose. Refer to specific protocol handout (if available) for more details.

| **Your white blood cells** may decrease after your treatment. White blood cells protect your body by fighting bacteria (germs) that cause infection. When they are low, you are at greater risk of having an infection. | To help prevent infection:  
  - Wash your hands often and always after using the bathroom.  
  - Avoid crowds and people who are sick.  
  - Call your doctor immediately at the first sign of an infection such as fever (over 100°F or 38°C by an oral thermometer), chills, cough, or burning when you pass urine. |
| **Nausea and vomiting** may occur after your treatment. Most people have little or no nausea. | See or call your doctor as soon as possible. |
| **Skin rashes** may sometimes occur.                                         |                                                                              |
| **Constipation** may sometimes occur.                                        |                                                                              |
| **Sugar control** may commonly be affected in diabetic patients.            |                                                                              |
| **Loss of appetite and weight loss** sometimes occur.                       |                                                                              |
| **Headache, and/or muscle pain or joint pain** may sometimes occur.         |                                                                              |
| **Tiredness** and lack of energy commonly occur.                            |                                                                              |
| **Swelling** of hands, feet, or lower legs may sometimes occur if your body retains extra fluid. |                                                                              |
| **You may sometimes have trouble sleeping.**                                |      
  - Talk to your doctor if you continue to have trouble sleeping.  
  - This will return to normal when you stop taking pembrolizumab. |
| **Increase in cholesterol or triglycerides** (one of the types of fat in the blood) may sometimes occur. | Discuss this with your doctor if you have:  
  - A history of heart disease.  
  - High blood pressure.  
  - High cholesterol or triglycerides.  
  You may need to have your cholesterol level checked a few months after starting pembrolizumab. |
Hair loss does not occur with pembrolizumab.

SEE YOUR DOCTOR OR GET EMERGENCY HELP IMMEDIATELY IF YOU HAVE:

- Signs of an allergic reaction (rare) soon after a treatment including dizziness, fast heart beat, face swelling, or breathing problems.
- Signs of an infection such as fever (over 100°F or 38°C by an oral thermometer), shaking chills; severe sore throat, productive cough (coughing up thick or green sputum); cloudy or foul smelling urine; painful, tender, or swollen red skin wounds or sores.
- Diarrhea or changes in bowel habits; black, tarry stools; blood or mucous in the stool; severe abdominal pain.
- Signs of lung problems such as new or worsening cough, chest pain, coughing blood, shortness of breath, or difficulty in breathing.
- Signs of kidney problems such as lower back or side pain, blood in the urine, swelling of feet or lower legs, or change in amount or colour of urine.
- Signs of blood sugar problems such as thirst and frequent need to pass urine.

SEE YOUR DOCTOR AS SOON AS POSSIBLE (DURING OFFICE HOURS) IF YOU HAVE:

- Signs of anemia such as unusual tiredness or weakness.
- Signs of liver problems such as yellow eyes or skin, white or clay-coloured stools.
- Signs of thyroid problems such as unusual weight gain or loss, feeling hot or cold, deepened voice, or unusual tiredness or weakness.
- Changes in eyesight, eye pain, or redness.
- Skin rash, blisters, or itching.

CHECK WITH YOUR DOCTOR IF ANY OF THE FOLLOWING CONTINUE OR BOTHER YOU:

- Headache not controlled with acetaminophen (e.g., TYLENOL®).
- Changes in skin colour (lightening).
- Irritability or forgetfulness.
- Decreased sex drive.
