

Breast Screening for Transgender, Gender-Diverse and Non-Binary People

This document provides evidence-informed breast screening recommendations for trans, gender diverse and non-binary people in British Columbia (BC).

1 Background

The goal of breast cancer screening is to reduce cancer related mortality and morbidity through early detection of the disease. The risk of under-screening is now recognized (1,2). Encouraging participation in breast screening should include the identification of vulnerable sub-populations, and adoption of specific strategies to address barriers to screening. One such group is the transgender, gender diverse and non-binary people of BC, with a recognized risk of underscreening.

Trans and non-binary people are more often medically under-served (3) and less likely to be up to date with breast and cervix screening than cisgender women (1,4-6). Factors contributing to the inequity in care include barriers to access, such as incomplete understanding of the population's specific needs. Furthermore, assessing screening eligibility for the transgender population may be challenging due to the various types of transition available to them. These types of transition include social (lifestyle alteration), medical (hormone therapy) and surgical (gender-affirming surgery) (1). Surgical transition may involve top surgery, such as breast construction (augmentation) or chest construction surgery (bilateral subcutaneous mastectomy). The screening strategy outlined in Table 1 includes recommendations for all transgender people, including those who have undergone top surgery and/or gender-affirming hormone therapy.

Definitions

Transgender	People who identify with a gender that is different from the sex they were assigned at birth.
Cisgender	People who have a gender identity that matches the sex they were assigned at birth.
Non-binary	An umbrella term to refer to diverse people whose gender identity is neither male or female.
Gender diverse	Gender roles and/or gender expression that do not match social and cultural expectations; gender non-conforming; gender variant.
Two-Spirit	A term used within some Indigenous communities, encompassing cultural, spiritual, sexual and gender identity.

The current trend is an increasing role for the primary care provider in the healthcare of trans people, rather than solely specialist care (7). This will be facilitated by familiarity with the above terminology, and adoption of pronouns and names used by the patient, which may differ from their identification and medical chart. Gender affirming language extends to discussion of signs and symptoms. For example, regardless of any surgery, a trans man would likely refer to his upper body as his chest, while a trans woman would likely refer to her upper body as her breasts. Provider knowledge of this breast screening policy, and such affirming language will contribute to best healthcare practices for the transgender community.

Trans and non-binary people are less likely to be up to date with breast and cervix screening than cisgender women.
